M2 Systems and Synthetic Biology (SSB)

Master

Mentions Biologie-AgroSciences | Biologie moléculaire et cellulaire

Régime(s) d'inscription

Formation initiale Formation continue

Langue(s) d'enseignement

Anglais

The vigorous development of Systems and Synthetic Biology constitutes a huge challenge that must be met both from the research and education perspectives. M2 SSB represents the first step towards nurturing a new brand of researchers and engineers to face up to the challenge.

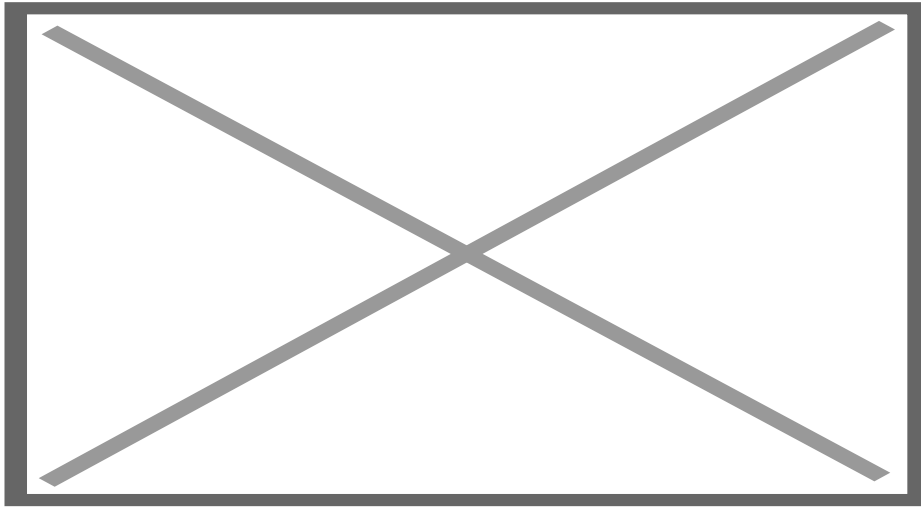

During the first semester, from September to end of January, students must attend 5 core compulsory modules and 5 elective modules (chosen among 12), for a total of 30 European Credits (ECTS). Refresher courses in either biology or mathematics and computer science are also proposed.

The second semester, from February to end of July, consists in a 6-months research training. Students may perform this internship in one of the academic laboratories or biotechnology companies located on site or elsewhere in France or abroad.

- [Programme](#)

Présentation

Compétences

- Apply engineering approaches to biology.
- Design, model and predict the behavior of biological synthetic parts, circuits and chassis.
- Recommend and execute experimental plans to engineer and test synthetic biological systems.
- Integrate concepts and technologies across disciplinary boundaries.
- Conceive and develop collaborative research work within interdisciplinary teams with applications in Systems & Synthetic Biology (iGEM).
- Anticipate the economical and societal challenges of synthetic biology to plan future career paths.

Objectifs pédagogiques de la formation

The aim of M2 SSB is to provide students from the Life Sciences, Mathematics, Engineering, Chemistry, Physical and Computer Sciences a mean to fruitfully engage in collaborative work across disciplinary boundaries, with applications in Systems & Synthetic Biology. Students undertaking the course will gain hands-on experience in experimental biology, modeling and designing. They will also enhance transversal capacities including planning a project, giving a seminar, perceiving the industrial, economical and ethical issues associated with these developing fields.

Débouchés

Professionnels

Après un Master ou Master + Doctorat : ingénieur (R&D, contrôle, production...)

Après un Master ou Master + Doctorat : chercheur ou enseignant-chercheur

Après un Master ou Master + Doctorat : ingénieur (recherche-développement, contrôle, production...) dans les domaines santé, pharmacie, agroalimentaire, biotechnologies, instruments et réactifs, cosmétique, dépollution et environnement

Secteurs d'activité : recherche fondamentale ou appliquée en Biologie, Santé ou Écologie dans le monde académique ou dans le secteur privé

Après Master + Doctorat : chercheur ou enseignant-chercheur

Après un Master ou Master + Doctorat : ingénieur (recherche et développement, contrôle, production...)

Ingénieur d'études / de recherche dans un service R&D dans l'industrie ophtalmique

Après un Master : Data scientist

Après un master : Chargé(e) d'études

Ingenieur R&D

Responsable de projets R&D

Responsable de projets R et D

Chef de projet

Ingénieur d'études dans les domaines de l'industrie

Public visé et prérequis

Applicants may come from Universities or from Engineering schools. After a first year of master (M1), or an equivalent qualification (4 years of successful higher education after finishing high-school), in either Biology, applied Mathematics, Computer Science, Chemistry or Physics. Bi-disciplinary curriculums including biology is favored, but highly-achieving and motivated students in any of the cited disciplines can apply.

Période(s) de candidature

Plateforme Inception

Du 21/01/2026 au 04/07/2026

Pièces justificatives

Obligatoires

Lettre de motivation.

Tous les relevés de notes des années/semestres validés depuis le BAC à la date de la candidature.

Curriculum Vitae.

Facultatives

Lettre de recommandation ou évaluation de stage.

ou nom et adresse de 2 référents

Pièce libre.

toute autre document que vous jugez nécessaire à l'évaluation de votre dossier

Tout document ou toute réalisation qui pourrait appuyer la candidature (étude de cas, création d'événement, etc.).

Dossier VAPP (obligatoire pour toutes les personnes demandant une validation des acquis pour accéder à la formation) <https://www.universite-paris-saclay.fr/formation/formation-continue/validation-des-acquis-de-lexperience>.

D'éventuelles lettres de recommandation.

Document justificatif des candidats exilés ayant un statut de réfugié, protection subsidiaire ou protection temporaire en France ou à l'étranger (facultatif mais recommandé, un seul document à fournir) :

- Carte de séjour mention réfugié du pays du premier asile
- OU récépissé mention réfugié du pays du premier asile
- OU document du Haut Commissariat des Nations unies pour les réfugiés reconnaissant le statut de réfugié
- OU récépissé mention réfugié délivré en France
- OU carte de séjour avec mention réfugié délivré en France
- OU document faisant état du statut de bénéficiaire de la protection subsidiaire en France ou à l'étranger.

Programme / plan / contenus

This 4course covers the following topics:

- Molecular Biology
- Genomics
- Systems Biology
- Synthetic Biology
- Structural Biology
- Evolution
- Cell Biology
- Bioinformatics
- Developmental Biology
- Presentation of the laboratory and of the Good

Laboratory Practice

- Discover the key Molecular Biology and Biochemistry tools and techniques used daily in biology laboratories.

Objectifs d'apprentissage

To facilitate research at common borders, the advanced introduction course aims at fostering a better understanding of the expectations, constraints, approaches and mode of thinking of a scientific partner across disciplines.

Within two week, this course brings participants belonging to a non-biological community (mathematics, engineering, chemistry, physical or computer sciences) to understand the research frontiers in biological sciences.

To reach this goal, key objects and concepts explaining the current research questions and methods will be presented and all the important and recent subdisciplines of biology will be covered.

Organisation générale et modalités pédagogiques

Cours magistraux : 15

Travaux dirigés : 7.5

Langue d'enseignement

Anglais

Enseignement à distance

non

Prérequis

The prerequisites for the course are a basic knowledge of discrete mathematics and an eagerness to engage in computational analysis. Students are assumed to have a solid background in biology.

Programme / plan / contenus

Syllabus:

- Probability-Statistics: Descriptive statistics, Probability, Random variables, Distributions, Central Limit Theorem, Hypothesis testing, Linear regression, Probabilistic modeling, Tests

- Data Analysis & Simulation: Introduction to R language, Introduction to Linux

Objectifs d'apprentissage

The course will present basic computational and mathematical concepts needed for genomic and data analysis.

At the end of the course, the student should be able to:

- perform basic statistical analysis on datasets
- understand formal concepts used for describing biological problems
- use R for basic data analysis
- be autonomous in a Unix/Linux environment

Organisation générale et modalités pédagogiques

The course comprises theoretical lectures and integrated theoretical and practical sessions (hands-on).

More analytically the course is organised as follows:

Matières	ECTS	Semestre	Cours	TD	TP	Cours- TD	Cours- TP	TD- TP	A distance	Projet	Tutorat
Advanced introduction to Mathematics and Computer Science for Biology	0	Semestre 1	7.5	10							

Advanced introduction to Mathematics and Computer Science for Biology

Travaux dirigés : 10

Langue d'enseignement

Anglais

Enseignement à distance

non

Prérequis

The prerequisites for the course are a basic knowledge of discrete mathematics and an eagerness to engage in computational analysis. Students are assumed to have a solid background in biology.

Programme / plan / contenus

Syllabus:

- Data Analysis & Simulation
- Machine Learning: Supervised learning, Unsupervised learning, Evolutionary algorithms
- Modeling (regular languages): Regular expressions, Finite automata, Formal grammar
- Introduction to discrete modelling and the use of formal mathematical structures to represent problems.
- Data Analysis & Simulation: Introduction to Python

Objectifs d'apprentissage

The course will present basic computational and mathematical concepts needed for systems biology approaches and data analysis and simulation. The course should enable students to understand more sophisticated mathematical and computational notions encountered in other modules.

At the end of the course, the student should be able to:

- understand formal concepts used for describing biological problems
- describe basic notions of machine learning
- understand formal concepts used for describing biological problems
- use Python for basic data analysis

Objectifs d'apprentissage

This module will equip the student with broad knowledge of synthetic biology, and the engineering of biological parts and devices.

Students will identify and define key concepts in Synthetic Biology / Engineering Biology: history, philosophy, objectives, positioning between biology and engineering, standardisation, chassis, and International Genetically Engineered Machine (iGEM).

They will be able to describe the roles of different genetic parts: promoters, ribosome binding sites, terminators, genes, reporters, plasmids, small RNAs, and ribo-regulators. They will be able to retrieve those parts from the common parts registries, and identify and annotate them in a given DNA sequence.

The students will be able to interpret genetic designs for expression of single and multi-gene circuits with different types of behaviour: constitutive, inducible, dynamic oscillatory, spatially patterned. They will be able to construct simple circuits using RNA, protein, and nucleoprotein parts; while taking into account expression levels (transcription and translation), codon usage, RNA stability, protein half-life, noise, and burden of the circuits.

The students will survey and compare prokaryotic and eukaryotic genetic circuits from literature, identifying differences between them. They will be able to troubleshoot malfunctioning biological circuits and build computational models of simple circuits.

Finally, they will be able to critique biological circuit designs, propose improvements to the designs, and justify and defend those improvements.

Organisation générale et modalités pédagogiques

The course module is organised as 11h of lectures and 9h of tutorials to introduce knowledge and methodological tools.

Enseignement à distance

non

Prérequis

none

Programme / plan / contenus

This course will cover up-to-date techniques for DNA assembly (eg Gibson, Golden Gate, LIC, SLIC...), for site-directed DNA recombination (eg Cre-Lox, integrase, etc.), multiplex gene and genome editing (eg PACE, CRISPR, TALEN...), genome-scale engineering (eg genome reduction, genome synthesis, genome transplantation, MAGE, CAGE...) and explore the implications of continued advances toward the development of flexibly programmable “chassis”, novel biochemistries (eg non-canonical amino acids, XNA...), and safer engineering (eg genetic confinement, synthetic consortia...).

Objectifs d'apprentissage

Genome engineering technologies are revolutionising Life Sciences as they enable the rational design of synthetic biological systems. Recent advances in genome engineering have dramatically expanded our ability to engineer cells in a directed and combinatorial manner.

At the end of the course, students will be able to:

- Explain the principles of several genome engineering techniques
- Adapt genome engineering techniques to a given scientific issue
- Conceive orthogonal systems and explain their advantages and limitations
- Evaluate on-going research in the development of flexibly programmable chassis

<u>Metabolic Engineering</u>	3.5	Semestre 1	12	8							

Metabolic Engineering

ECTS : 3.5

Semestre calendaire : Semestre 1

Détail du volume horaire

Cours magistraux : 12

Travaux dirigés : 8

Langue d'enseignement

Anglais

Enseignement à distance

non

Prérequis

Understanding metabolic pathways and enzymatic reactions is crucial. A background in molecular biology, gene expression, regulation, and recombinant DNA technology is typically required, as well as knowledge of chemical or biochemical engineering principles. **A solid understanding of central metabolism and major metabolic pathways is also essential.** In addition, the use of computational bioinformatic tools is required in this course.

Programme / plan / contenus

The purpose of the metabolic engineering is to generate a cell factory that produces cost-effective molecules at industrial scale. This course aims to provide the basic concepts and tools that have been developed the past 20 years when designing, building and testing metabolic pathways for bioproduction purposes. Practical applications and successes will be surveyed by an industrial (Abolis Biotech). A particular emphasis will be given to two research forefronts of metabolic engineering (1) how can we learn to improve pathway performances using flux analysis and genetic engineering and (2) how pathway engineering can be used to build biosensor and biocomputation devices.

Objectifs d'apprentissage

Metabolic engineering is becoming a mature field of research with many industrial applications. It is a process of optimizing native metabolic pathways and regulatory networks or assembling heterologous metabolic pathways for production of targeted molecules using molecular, genetic and combinatorial approaches.

At the end of the course, students will be able to:

- Explain the various steps and methods necessary to perform a metabolic engineering project

Programme / plan / contenus

This course will cover all steps of a synthetic biology project (production of metabolites by a host), either for fundamental purposes such as understanding the rules controlling biological systems or for engineering purposes such as production of molecules of interest by living systems.

Emphasis will be put on the concept of process, with quality control checkpoints, discussions on the inherent and manageable variability of the input sources (the biological system – the human experimenter) and collective data analysis sessions.

As a practical course, it will recall general safety rules and good practices in the laboratory.

Objectifs d'apprentissage

The objectives of this course are:

- To practise classical molecular biology techniques at the bench for the purpose of synthetic biology, especially when students are not familiar with the wet-lab.
- To get the know-how of experimental acquisition of data from complex biological systems.
- To go through the process of a synthetic biology project, from its experimental design to data interpretation.

Organisation générale et modalités pédagogiques

As a practical course, this module will be organised in several sessions scheduled over two weeks on the basis of experimental constraints.

During the first part, some gene manipulation will be performed (DNA purification, PCR amplification,

Programme / plan / contenus

The course will be divided into four parts:

I. Definitions and actors involved: synthetic biology "seen from the outside".

II. The majority position: from ethics to engineering of living matter

III. The critical capacities of researchers: limits or impotence of ethics?

IV. The unthinking of ethical posture: about the blind spots of biotechnological progress

V. Chemical toolkit as genetic firewall and reengineering living organisms.

Objectifs d'apprentissage

At the end of this course, students will be able to:

- describe the diversity of definitions, institutions and actors in synthetic biology in France.
- identify the dominant trend in the ethics of engineering of life.
- distinguish the plurality of points of view that the actors of synthetic biology have on their practice.
- analyse the unanswered questions that synthetic biology raises about biotechnologies
- conceive a reflexive approach towards synthetic biology by taking into account their own relationship with the discipline (trajectory, choice of object, meaning it has given to it, critical questioning with regard to the research

Elective Modules

Travaux pratiques : 6

Travaux dirigés : 3

Langue d'enseignement

Anglais

Enseignement à distance

non

Prérequis

Several optional modules from Master 1 BMP and BA are highly recommended:

Systems Biology I

Systems Biology II

Cellular Economics

Programme / plan / contenus

In this course, we will seek to practically explore the “pipeline” of chassis design. The methods for the analysis of flux distribution, from constraint-based modelling (Flux Balance Analysis, Resource Balance Analysis, etc.) to dynamical modelling (Ordinary Differential Equations, etc.) are at the core of this course.

Objectifs d'apprentissage

Metabolic engineering and cell factory design are disciplines that sprung up at the interface of chemical engineering, biotechnology, biochemistry, classical genetics and modelling. In particular, the design of a cell factory involves global analysis of the production organism (genomics, transcriptomics, proteomics, metabolomics) coupled to the development of a dedicated, mathematical model of the whole cell in order to define in silico the optimization strategy and the required modification of the strain to be implemented through the means of genetic manipulations.

At the end of the course, students will be able to:

- Explore models enabling to handle in details entire cellular networks
- Evaluate different strategies for in silico cell factory design
- Choose the most suitable approach to conceive a bacterial cell factory for a given target metabolite

non

Prérequis

none

Programme / plan / contenus

- Collective debriefing on the purpose of the practical course and the protocol

- Manipulations: preparing E. coli, pouring, degassing, baking, then peeling off the PDMS chip from the master mold, creating inlet/outlet, sealing the chip to a coverslip by using plasma treatment, injecting/spinning cells into chip's growth channels, preparing tubing and growth medium, flowing the growth medium into the device by using a syringe pump, performing image and data analysis on images previously generated using this type of chip

Objectifs d'apprentissage

The main pedagogical intention behind this training is to:

- introduce students to the use of the microfluidic tool for biology research, to highlight its specificities and potentialities.

- allow students to build/use on their own a specific microfluidic chip which allows monitoring growth, gene expression or mutation accumulation in single cells of rod-shaped bacteria on long timescales (i.e. few hundreds of generations)

At the end of the training, students will be able to:

- state the differences (advantages and disadvantages) between macrofluidic and microfluidic systems for biology research

- define and explain the main steps in the construction of a microfluidic chip

- build a microfluidic chip in PDMS (from a reusable master mold)

Prérequis

1. **basics of computer science (complexity, automata theory, langage theory)**
2. **basics of the biology of DNA**

Programme / plan / contenus

1. **Presentation of DNA self-assembly, theory and experiments.**
2. **Biomedical applications of DNA self-assembly : reading and discussion.**
3. **Supervised project on the design of a DNA origami.**

Objectifs d'apprentissage

1. **Understand the basic principles of DNA self-assembly and DNA computing.**
2. **Understand basic applications of DNA nanotechnology in biology and medicine.**
3. **Learn how to design basic DNA nanostructures.**

Organisation générale et modalités pédagogiques

This class starts by a brief presentation of the computational aspects of DNA self-assembly and the experimental technique of DNA origami. This presentation is followed by a reading session in which the students are encouraged to present their favorite aspects in detail to their peers. The class ends with a practical assignment in the DNA origami design software <https://www.ens-lyon.fr/ensnano/>, in which the students are encouraged to design a shape having a high probability of folding in a test tube.

Prérequis

The course prerequisites are a basic knowledge of molecular and structural biology, bioinformatics and thermodynamics.

Objectifs d'apprentissage

This course provides an overview of the techniques used in computational protein design, from molecular modelling to in silico combinatorial library design, including those practical aspects associated with the integration of such computational techniques into a protein engineering project.

The course covers various aspects of the field, including an overview of protein molecular modelling and dynamics, protein activity modelling, protein engineering, and protein design techniques:

- Molecular modelling: atomistic, descriptor-based, and knowledge-based models; solvent representations, AI for protein structure prediction.

- Force field-based techniques: energy minimization and molecular dynamics.

- Docking techniques: protein-protein, protein-peptide, and protein-small molecule interactions.

- Descriptor-based modelling of biological activities: quantitative structure-activity relationship models.

- Knowledge-based modelling: rotamer libraries, large-scale analysis of propensities.

- Machine-learning and deep learning modeling.

- Protein design: search algorithms, combinatorial optimization, and library design.

- Design of protein-based properties for synthetic biology applications: novel enzymatic, regulatory, and signalling

Basic knowledge of Python programming and the use of Python libraries.

Objectifs d'apprentissage

At the end of this course, the student will be able to:

- Understand traditional learning methods such as multiple linear regression, support vector machines, random forests, and neural networks (dense, convolutional and recurrent) as well as active and reinforcement learning methods.
- Understand cross-validation methods for classification and regression
- Define the needs for experimental design and learning for classical problems in the construction of metabolic pathways and synthetic circuits developed in synthetic biology
- Design a synthetic circuit to be implanted in a biological system (cellular or acellular) capable of performing a basic learning operation (weighted sum, activation function)
- Use Python libraries (such as pyDoE, Keras, Scikit-Learn) to create an experimental design and simple learning on a biological data set.
- To be familiar with the use of learning methods in the fields of human health and image recognition.

Organisation générale et modalités pédagogiques

Teaching in this EU will include lectures in experimental design, machine learning, and their applications in synthetic biology and human health. Some courses will be given by external invited speakers. Simple exercises (TD) will be given during the courses on specific points. At the

Students attending the course should have a regular background in fundamental and applied microbial molecular biology: regulation of gene expression, nucleic acid methods, basics in (bio)chemistry and microbial physiology (Bachelor of Sciences or equivalent). Being a transdisciplinary course, diverse backgrounds are welcomed, as long as willingness to investigate missing or new concepts is a goal of the attendee.

Objectifs d'apprentissage

The development of a sustainable, bio-based economy that does not depend on fossil fuels for energy and commodities and has a low environmental impact is a major goal as well as a big societal challenge. Modern technologies have provided new ways for increasing knowledge, understanding bioprocesses and testing potential applications. This course will focus on topics like biodegradation and bioremediation of legacy as well as emerging pollutants (incl. heavy metals, pesticides and plastics) and microbial engineering for the use of renewable resources and their underlying biological and technological principles. It aims to give students clues to :

- understand the input of microbial genome sequences and integrated -omics strategies to fill in knowledge gaps concerning degradation pathways
- describe technological and analytical tools available in the field and envision the upstream processing (inputs, bottlenecks, gaps)
- analyse scientific literature, interpret data
- cross-analyze various scientific and methodological options and make strategic choices at the onset of a project

- formulate accurate strategies to bring about a project to its goal, develop critical thinking toward results and

Prérequis

Basics in chemistry and physics (level L1 – Bac +1)

Fundamentals of Chemical Engineering : mass balance, material and heat transfer

Programme / plan / contenus

“Downstream Processing” applied to industrial biotechnology is defined as "all unitary operations aimed at extracting and purifying biomolecules resulting from the fractionation or bioconversion of renewable materials".

It is an essential step in biotechnologies and biorefineries, which aim to substitute fossil resources and develop new, more sober and ecological production processes from vegetal biomass. Indeed, it is generally the most expensive and the most impacting on the environment because of the number of operations required to obtain the final product(s).

The general objective of this course is to train executives capable of defining innovative, competitive and more environmentally friendly separation strategies by cleverly choosing and combining modern or more conventional technologies.

After the presentation of a rather broad panorama of the usual techniques, a reasoned choice guide will be proposed as well as courses to learn how to optimize and pre-dimension certain processes that are essential in biorefineries such as membrane filtration, electrodialysis, ion exchange, adsorption, gas-liquid absorption, liquid-liquid extraction, distillation or preparative chromatography.

Objectifs d'apprentissage

The objective of this course is to train managers capable

Programme / plan / contenus

Syllabus:

INTRODUCTION

- Motivation and challenges for biology, health, nanotechnology, molecular storage
- Principle of electrical detection
- Experimental Setup
- Analysis of data

NANOPORES, NANOTUBES

- Protein channels
- Solid-states pores
- Biomimetic channels
- Hybrid pores
- Nanotubes and Nanochannels

DYNAMICS OF IONS TO BIOMOLECULES

- Introduction physical concept: polymer conformation, size, flexibility and rigidity, dilute and semi_dilute solution
- Ions
- Polymers
- biomolecules

APPLICATIONS

- Protein folding
- Ultrafast DNA and protein sequencing
- Mass and size discrimination by nanopores
- Biomarker and virus detection

PRACTICAL COURSE

- Lipid bilayer formation
- Protein nanopore insertion into membrane
- Electrical measurements

Détail du volume horaire

Cours magistraux : 20

Langue d'enseignement

Anglais

Enseignement à distance

non

Prérequis

Mathematical background, basic knowledge on programming language and algorithmics, molecular and cellular biology

Objectifs d'apprentissage

Network analysis is widely used in system biology and precision medicine to gain a comprehensive understanding of molecular interactions. A network is a dynamical system represented structurally by a graph. The objective of this course is to provide the fundamental background in network analysis combining theoretical, computational and biological knowledge.

Topological analysis:

- Mastering the fundamental graph measurements with their algorithms,
- Compute the different centralities and apply them in biological study,
- Identify the class of a real/random networks to deduce their properties,
- Apply a topological analysis on a biological case to discover relevant properties.

Dynamical analysis:

The student should master and practically use:

- the basis Boolean network modelling,
- the basis of Petri nets modelling,
- the basis of neural network modelling,
- the design of a network model based on data and literature with the resulting analysis.

Prérequis

none

Objectifs d'apprentissage

The objectives of this course are to provide students with an understanding of practical aspects developed in the laboratory for the study of proteins and, through concrete examples of recombinant proteins, illustrate the experimental methods for protein design and gene modification by mutagenesis in order to obtain the desired function by controlling the structure / function relationships.

At the end of the course, students will be able to:

- Perform wet lab experiments for the study of proteins
- Remodel genes by site-directed and / or random mutagenesis
- Compare in vivo and in vitro studies of the activity of the wild type protein and its mutants

Correlation of experimental results with the theoretical model developed using the skills acquired in the module "Computational protein design" is strongly encouraged.

Organisation générale et modalités pédagogiques

This module will be organised in 3 sessions scheduled over 3 days on the basis of experimental constraints.

Enseignement à distance

non

Prérequis

none

Programme / plan / contenus

Covered topics:

- Next generation sequencing technologies(illumina, long-read sequencing).
- NGS applications (Genome sequencing, Deep mutational scanning, RNA-seq)
- Bioinformatics (Read mapping and filtering for analysis).
- Calculating interpretable scores (fitness, enrichment, fold change) to interpret mutation/gene effects
- Data normalisation
- Statistical tests for differential analysis
- Interpreting errors and noise in data
- Clustering, principal component analysis
- Data visualisation
- Simulations of dynamics

Objectifs d'apprentissage

Next-generation sequencing is emerging as a powerful tool for genotype-phenotype mapping. The objective of the course is to train the students with the analysis of next-generation sequencing for different applications of next-generation sequencing: Genome sequencing, Deep mutational scanning, and RNA sequencing. In the course, the students will learn how to analyse real experimental data, which will help them develop a critical understanding to design high-throughput experiments and interpret data when reading results published in the scientific literature.

Organisation générale et modalités pédagogiques

Methods will be illustrated by the practical analysis of

Prérequis

Basic knowledge of molecular biology

Programme / plan / contenus

This course class is composed of 8h of lecture and 12h of practical work using the MICALIS cell-free biofoundry.

The practical work will include the usage of the biofoundry software platform to maximize protein productivity in cell-free.

Objectifs d'apprentissage

The objectives of this course are to provide students with an understanding of practical aspects developed in the laboratory for the study of cell-free systems and, through concrete examples, illustrate experimental methods to increase protein production in cell-free.

At the end of the course, students will be able to:

- Know the diversity and the different usages of cell-free systems
- Know-how to prepare cell-free systems from cell cultures and cell extracts
- Understand the element required to obtain a functional transcription translation (TX-TL) system.
- Use the automated protocol hosted on the Cell-Free Biofoundry at MICALIS
- Know-how to optimise the productivity of cell-free systems

Organisation générale et modalités pédagogiques

Teaching in this EU will include 8 hrs of lectures with simple exercises (TD) given during the courses on specific points and 12hrs of practical work (TP). The practical work will consist of expressing a protein of interest using the Cell-Free biofoundries hosted at the Micalis institute.

Bibliographie

Research Internship

ECTS : 30

Semestre calendaire : Semestre 2

Langue d'enseignement

Anglais

Enseignement à distance

non

Programme / plan / contenus

The internship allows students to develop a research project and apply wet and/or dry lab experimental approaches to solve a scientific question.

Objectifs d'apprentissage

The last semester of M2 SSB consists in a 6-month internship of training through research in an academic research laboratory or in biotech companies. It can take place in France or abroad.

The internship is supervised by a confirmed researcher and, at the end, students will become independent and able to

- choose the most appropriate scientific strategies,
- analyse critically the results obtained
- synthesise and present, in oral and written form, a scientific research process and the results obtained.

Moreover, students will integrate a research team and participate to all daily activities, laboratory meetings and conferences.

Organisation générale et modalités pédagogiques

The internship lasts 6 months and can take place in an academic laboratory or in the R & D department of a private company, in France or abroad.

At the end of the internship, students write a research report and make an oral presentation that highlights the scientific questions addressed, the experimental models used, and present and discuss critically their results.
